

Bowron Lake (1A08)

53.25N 121.37W 1280m

Status: Active, Data Range: 1960 – 1981, Most Recent Data: 1981-05-11

Manual snow survey locations are sampled once per month during the snow season, generally between late December and June, although some sites are sampled less often. The dark blue dots are from the current snow season (Jan – June yearly) while the white bars represent historical data ranges from the station.

Full Explanation: The above box and whisker plot shows five statistics, the first and third quartile, the median, and two whiskers. The whiskers extend to the largest value or no further than $1.5 \times \text{IQR}$ from the third quartile (where IQR is the inter-quartile range, or distance between the first and third quartiles). The lower whisker extends from the first quartile to the smallest value or at most $1.5 \times \text{IQR}$. Data beyond the end of the whiskers are called 'outlying' points and are plotted individually.
